

NASA TECH BRIEF

Langley Research Center

NASA Tech Briefs announce new technology derived from the U.S. space program. They are issued to encourage commercial application. Tech Briefs are available on a subscription basis from the National Technical Information Service, Springfield, Virginia 22151. Requests for individual copies or questions relating to the Tech Brief program may be directed to the Technology Utilization Office, NASA, Code KT, Washington, D.C. 20546.

Microorganism Sample Device

A compact device automatically collects microorganism specimens from circulating air streams. The device may find application in air pollution studies involving the collection of airborne microbial specimens.

impingement nozzle (see figure). The agar acts as an inert carrier for the specimens and provides sufficient moisture to prevent their dehydration.

Thin layers of the agar are deposited in square bands along one surface of a continuous length of

The device is based on a gel-impingement technique in which the microorganisms are separated from the atmosphere by a rapid 90° change in the flow direction of the air stream. The separated microorganisms impinge upon and adhere to an agar surface on an impervious plastic tape moving past an

the tape. Intervening areas are covered with an adhesive, and a second impervious film is pressed over the entire surface, thereby providing a protective cover and seal for the agar squares. The composite tape is wound on the supply reel, and the detachable cassette housing the takeup reel is

(continued overleaf)

insulated and provided with coolant passages to maintain a temperature of 10° F.

As the composite tape unwinds, the protective film is stripped off, the agar areas are exposed to the air flowing from the impingement nozzle, and the film rejoins and reseals the tape before it reaches the takeup reel. At the end of the sampling period, a spring-loaded guillotine is manually actuated to sever the tape and seal off the coolant passages in the cassette. A quick-release clamp is then opened, allowing the cassette to be removed.

Notes:

1. Related information is contained in NASA Tech Brief 69-10223.
2. No additional documentation is available.

Patent status:

No patent action is contemplated by NASA.
